

From Reactive to Proactive

Using Risk Stratification and Predictive Analytics to Design Affordable Universal Healthcare

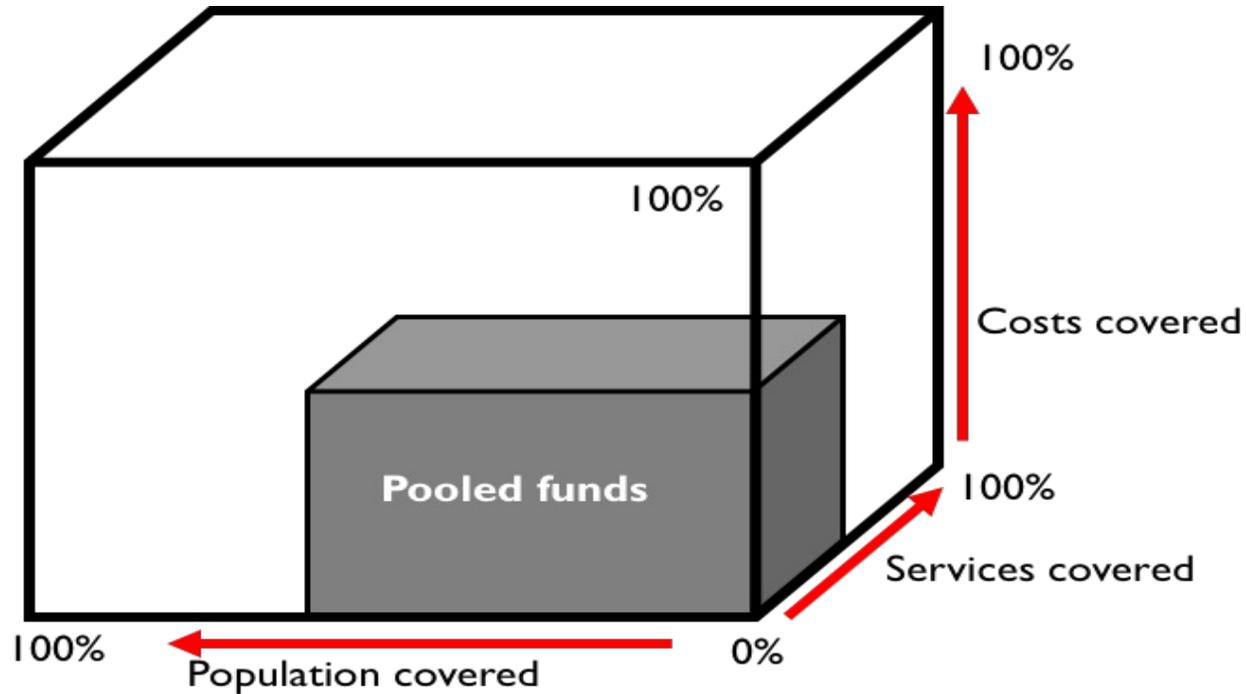

International Arab Actuarial Conference 2026

Presented by: Zainab Shikely

February 2026

What is UHC?

World Health Organisation (“WHO”):

Universal Health Coverage - a scenario where **all people** have access to the health **services they need**, when and where they need them, **without financial hardship**.

Seeks to achieve **equity, efficiency and quality**

“Global health 2035: a world converging within a generation,” vol. 382, 2013

The UHC Paradox

- Demographic shifts and ageing populations across many regions
- Chronic disease as a dominant driver of healthcare expenditure
- Healthcare cost growth consistently exceeding general economic growth

The Sustainability
Crisis

- Care delivery triggered after illness occurs
- Actuarial and financial models often backward-looking
- High-cost interventions concentrated at crisis points

The “Reactive”
Legacy

- Traditional: Risk adjustment focused on fair payment for past utilisation
- Emerging: Risk stratification focused on targeted intervention for future health needs

The Missing
Design Layer

A proactive UHC system requires an intelligence layer between the patient and the provider

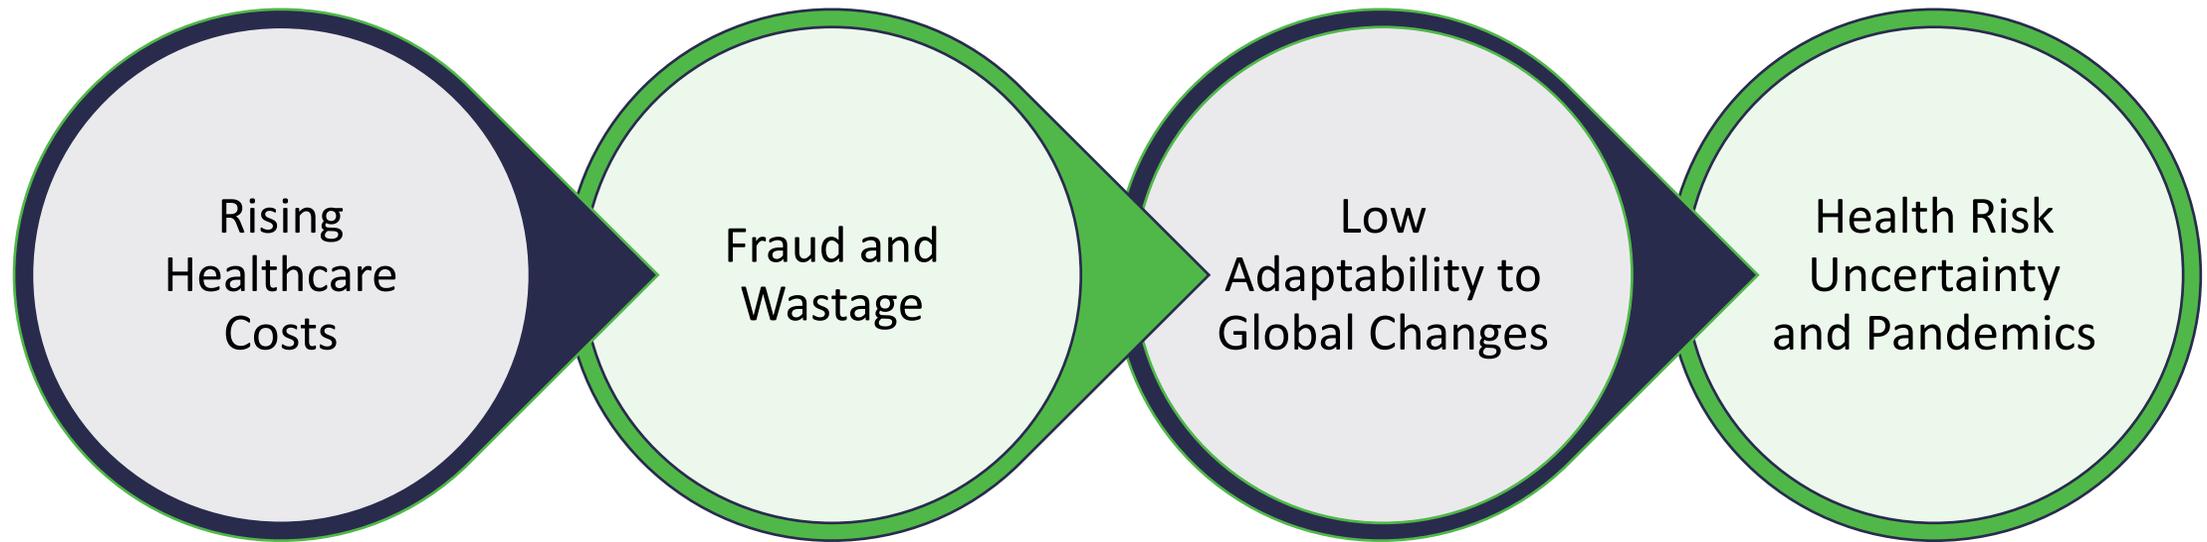

Predictive Analytics

Predictive analytics is a data-driven approach that leverages historical data, statistical algorithms, and machine learning techniques to predict future events or outcomes.

Why Care?

- Predictive Analytics can help us tackle some of the **major pain points** within both the healthcare and insurance industries.

Risk Stratification

Risk stratification is the systematic grouping of individuals based on their likelihood of experiencing future health events, using clinical, utilisation, and demographic data to guide proactive care and resource allocation.

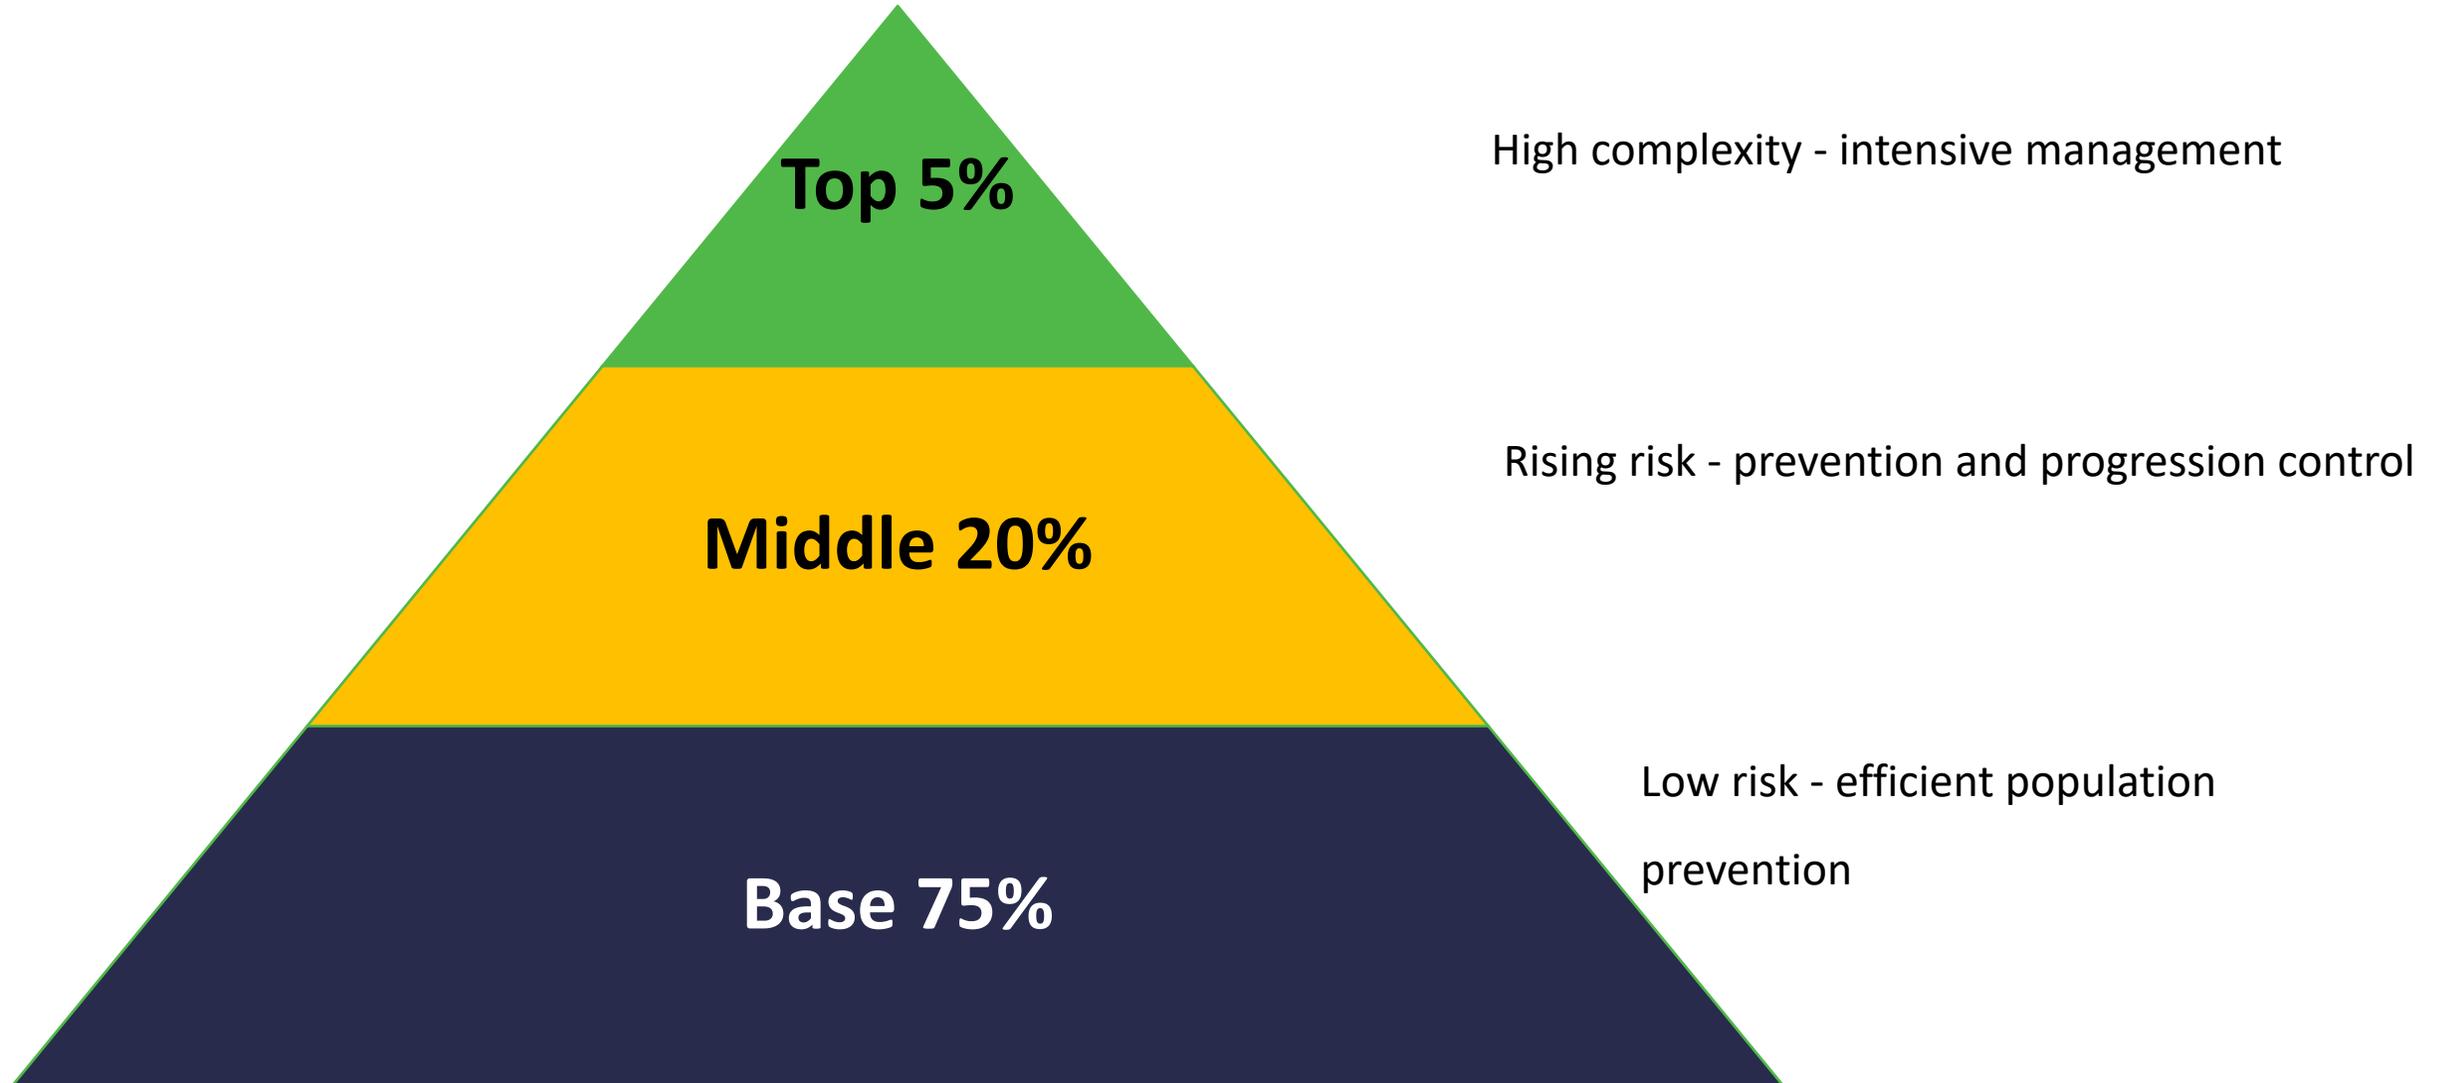

Low Risk

Rising Risk

High Risk

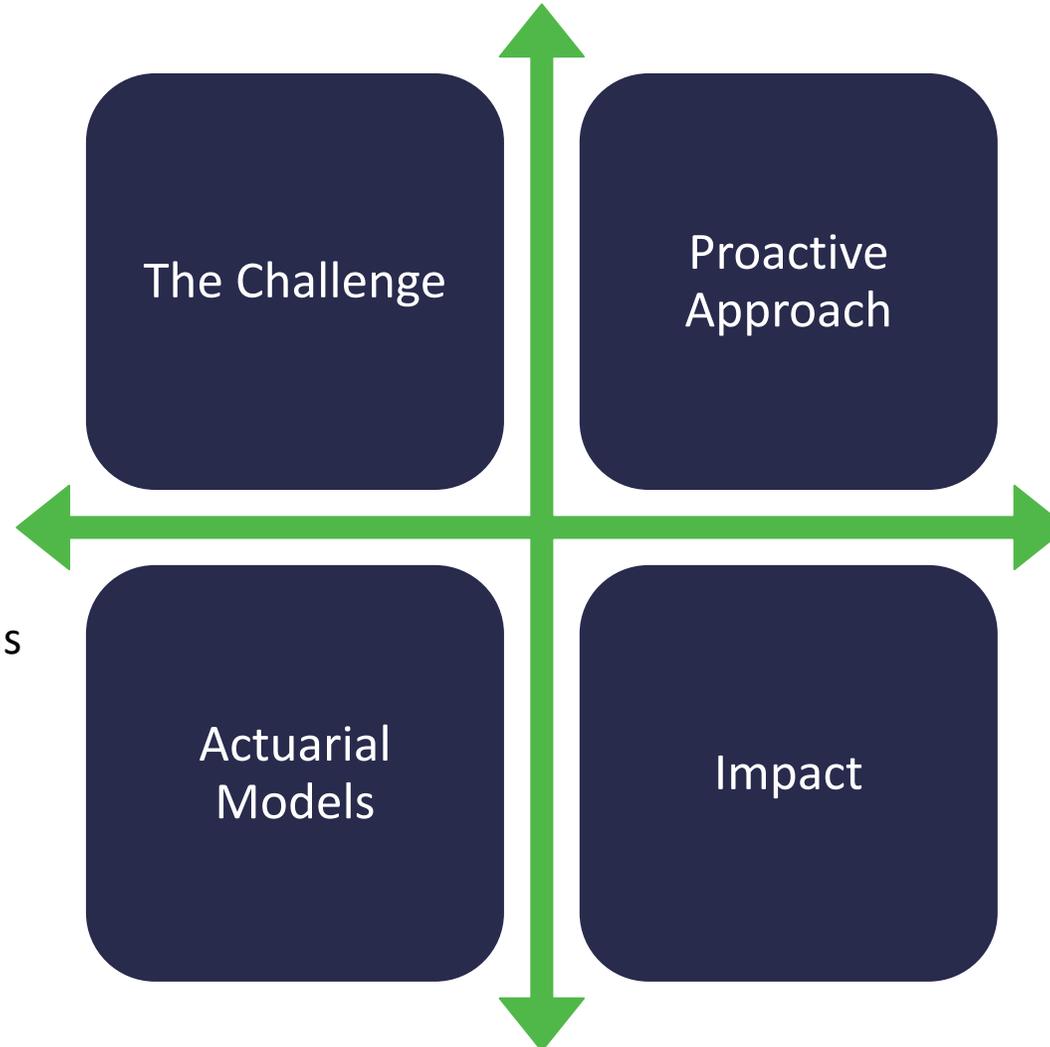

The Population Health Pyramid

Case Study - Singapore's Healthier SG & Discovery AI

- Hospitals alone are unsustainable
- Need to prevent chronic disease complications

- Predicts multiple readmissions (~70% accuracy)
- Flags risks 40 weeks before clinical crisis
- Shifts spending from hospital claims → preventive care

- Citizens enrolled with a single-family physician
- Discovery AI integrates health records, lifestyle, and admissions

- Reduces nurse vetting workload by 10–15%
- Enables proactive budget allocation
- Focuses resources on high-risk patients

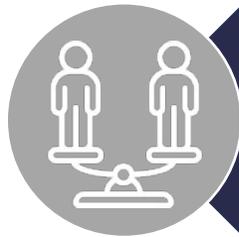

Challenges & Ethical Considerations

Balancing Accuracy and Fairness

Patient Autonomy and Informed Consent

Equitable Access

Zamara's Initiative

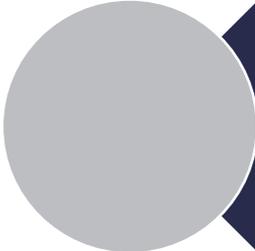

At Zamara, our aim is to help companies and Public Health Schemes **unlock the power of their data.**

From Data Crunchers to System Architects

Integrate fragmented data into usable intelligence

Focus on rising-risk populations

Measure success through health outcomes, not just cost containment

Thank You!

 **Better with**

Zamara

Your financial and insurance partner,
powering your prosperity.
